

IN THE CLAIMS

1. (Currently amended) A system unit comprising a media drive bay, the media drive bay comprising:

a drive bay housing configured to receive a media drive;

a connector to interface with a connector on a rear surface of a received media drive;

a resilient tongue formed integrally ~~integral~~ with a first side of the media drive bay housing, which resilient tongue is operable to urge onto a received media drive; and

a detent for latching a latching member attached to the media drive; and support surfaces defined on a second side of the drive bay housing opposite to the first side, whereby the resilient tongue applies pressure on an inserted media drive to press the media drive against the support surfaces.

2. (Cancelled)

3. (Currently amended) The system unit of claim 1 2, wherein the support surfaces form slides within the drive bay housing.

4. (Original) The system unit of claim 1, further comprising a media drive.

5. (Original) The system unit of claim 4, wherein the media drive comprises a latching member of springy metal, the latching member being secured to a rear surface of the media drive.

6. (Original) The system unit of claim 5, wherein the latching member is secured to the rear surface of the media drive by screws that engage with pre-existing holes on the media drive casing.

7. (Original) The system unit of claim 6, wherein the latching member comprises a plate that is secured to the rear surface of the media drive and a resilient latching

projection configured to latch behind the detent of the media drive bay housing when the media drive is received by the media drive bay housing.

8. (Original) The system unit of claim 4, wherein the media drive is a commercially available media drive for non-removable use, the media drive being modified by the provision of the latching member to provide for removability.

9. (Original) The system unit of claim 1, wherein the system unit is a rack-mountable computer server.

10. (Currently amended) A media drive comprising a connector at a rear surface thereof and a latching member to be secured to a said rear surface of a media drive, the latching member comprising a plate including formations to enable securing of the latching member to the rear surface of the media drive and an integral resilient latching projection.

11. (Currently amended) The media drive latching member of claim 10, wherein the latching member is operable to latch behind a detent of the media drive bay when the media drive is received by a media drive bay.

12. (Currently amended) The media drive latching member of claim 10, wherein the formations comprises holes for receiving screws.

13. (Currently amended) The media drive latching member of claim 10, wherein the latching member is formed of springy metal.

14. (Currently amended) A media drive, commercially available for non-removable use, the media drive comprising a connector at a rear surface thereof and being modified by the provision of a latching member, the latching member comprising a plate including formations to enable securing of the latching member to the rear surface of the media drive and an integral resilient latching projection.

15. (Currently amended) The media drive of claim 14, wherein the latching member is operable to latch behind a detent of ~~a~~ the media drive bay when the media drive is received by a said media drive bay.

16. (Currently amended) The media drive of claim 14, wherein the formations comprise ~~comprises~~ holes for receiving screws, the latching member being secured to the media drive by screws that pass through the holes into a rear surface of the media drive.

17. (Original) The media drive of claim 14, wherein the latching member is formed of springy metal.

18. (Currently amended) A system unit comprising media drive bay means, the media drive bay means comprising:

drive bay housing means for receiving a media drive;

connector means for interfacing with co-operating connector means on a rear surface of a received media drive;

resilient tongue means, ~~integral with the media drive bay housing means~~, for urging onto a received media drive, said resilient tongue means being formed integrally with a first side of the media drive bay housing means; and

detent means for latching a latching member attached to the media drive; and support means defined on a second side of the media drive bay housing means opposite to the first side, whereby the resilient tongue means applies pressure on an inserted media drive to press the media drive against the support means.

19. (New) The media drive of claim 10, wherein the latching member is secured to the rear surface of the media drive by screws that engage with pre-existing holes on the media drive casing.

20. (New) The media drive of claim 19, wherein the latching member comprises a plate that is secured to the rear surface of the media drive.

21. (New) A system unit comprising:

a media drive bay with a connector; and

a media drive received in the media drive bay, the media drive comprising a connector at a rear surface thereof and a latching member secured to said rear surface, the latching member comprising a plate including formations to enable securing of the latching member to the rear surface of the media drive and an integral resilient latching projection.

22. (New) The system unit of claim 21 comprising a resilient tongue formed integrally with a first side of a media drive bay housing of the media drive bay, which resilient tongue is operable to urge onto a received media drive, and a detent for latching the latching member of the media drive.

23. (New) The system unit of claim 22, further comprising support surfaces being defined on a second side of the drive bay housing opposite to the first side, whereby the resilient tongue applies pressure on an inserted media drive to press the media drive against the support surfaces.

24. (New) The system unit of claim 23, wherein the support surfaces form slides within the drive bay housing.
